

Defensive Posture Management with Reach Security & ANM

IN PARTNERSHIP WITH
 Reach

Stay a step ahead of attackers and safeguard your company with the strongest defensive posture possible

Getting 100% of the value from the security products you already use is critical to delivering your organization's strongest defensive posture. But tools and platforms required are becoming more complex, and threats are becoming more sophisticated. Attackers continue to adapt with new techniques to masquerade their delivery and bypass defenses, which leaves us wondering if the security products we already use are optimized to provide the best protection possible for our businesses.

QUESTIONS TO CONSIDER

- How does your team prioritize new security projects for immediate ROI?
- What metrics are you using to justify more security budget from the board?
- When was the last time you deployed a product and how did you measure its rollout success?
- What security hygiene initiatives have you set for the year?
- How are you maintaining an inventory of capabilities served by your current vendors?
- How are you measuring security product performance today?

53%

of IT Security Leaders say they don't know if their cybersecurity tools are working.

— Ponemon Study

WHAT SETS REACH & ANM APART

- » We focus on helping you do more with the tools and resources you have
- » We believe that security should be tailored uniquely to each customer, not the other way around.
- » We focus not only on consultation, but execution
- » We accelerate time to value and measurement of your products from months to hours

Working together, Reach Security™ and ANM empower security leaders and operators to measure, manage, and celebrate the value they're getting from their security investments. As a new innovation in cyber security, Defensive Posture Management adapts to each client's needs by building a strategy that ensures the best possible configurations for your products are deployed, while simultaneously unlocking visibility into how your products are performing.

Every business has its own unique challenges and opportunities when it comes to helping people connect, share and get work done. That's why ANM delivers solutions that are powerful, innovative and tailored to each client's precise needs.

How It Works

ANM and Reach Security™ use a threat-informed approach to tailoring the approach to meet the unique requirements of each client factoring in the products the team already uses. Following this approach allows you to identify, report, and remediate gaps, while allowing members of your team to focus on security outcomes instead of security products.

All that's required to start is a set of lightweight API connections. Setup is completed in a matter of minutes and results are available within an hour. ANM and Reach will:

- 1 Understand how your organization is being attacked (e.g. who, how, and with what frequency) and what preventative capabilities are available from the products you already own.
- 2 Measure how well your products are configured to protect the organization and help rationalize the value you are getting from them.
- 3 Translate threats observed to custom configurations for better protection using your existing security products.
- 4 Automate the deployment of configuration improvements back to your products to fill gaps and reduce risk.

USE CASES AND OUTCOMES

TOOL RATIONALIZATION AND USAGE REPORTING

Gain immediate visibility into each product's ability to stop threats relevant to your organization based on their configurations

DETECT AND MITIGATE CONFIG DRIFT

Monitor controls to catch and remediate misconfigurations across your enterprise security stack

DATA-DRIVEN RESPONSES TO REDUCE CYBER PREMIUMS

Leverage a comprehensive view of your tools to respond to security questionnaires with quantifiable data

ACCOUNT TAKEOVER AND SINGLE SIGN-ON (SSO) ATTACK SURFACE REDUCTION

Identify and action on MFA security policy gaps and reduce SSO attack surface

AUTOMATED COMPLIANCE MAPPING

Automatically map deployed configurations to compliance standards like NIST CSF, 800-53, ISO-27001, CIS, and more

ZERO TRUST/IDENTITY AS NEW PERIMETER PROTECTION

Automatically introduce additional control hardening from an identity-centric POV. Know the 5% of people who account for +80% of the risk
